EDU Explosive Disruption/Disposal Shield Operations Sheet

The shield is designed to be used by those requiring protection from small anti-personnel mines during mine clearance operations. The shield has two retractable legs that can be placed into the ground to support the shield in the upright position unaided, allowing the operator complete use of his hands to manoeuvre the shield using the interchangeable handles.

Position the shield so that it offers maximum protection to the body, especially the vital organs. Use the viewing port to avoid exposure of the head and eyes to the target area.

A telescopic manipulator can be used through the manipulator hatch when necessary.

Use the retractable legs to keep the shield upright in position.
